Ultimate SQL Cheat Sheet

SQL KEYWORDS

SQL KEYWORDS

KEYWORDS	DESCRIPTION	KEYWORDS	DESCRIPTION
	Adds a new column to an existing table.		Deletes a column from a table.
ADD	Example: Adds a new column named email_address' to a table named 'users!.	DROP	Example: Removes the first_name column from the users table.
	ALTER TABLE users	COLUMN	ALTER TABLE users
	ADD email address varchar(255);		DROP COLUMN first_name
	It creates a new constraint on an existing		Deletes the entire database.
	table, which is used to specify rules for any data in the table.	DROP	Example: Deletes a database named 'websitesetup.
ADD	Example: Adds a new PRIMARY KEY	DATABASE	DROP DATABASE websitesetup;
CONSTRAINT	constraint named 'user' on columns ID and SURNAME.		BIOT BATABAGE Websitesetap.
	ALTER TABLE users		Removes a default value for a column.
	ADD CONSTRAINT user PRIMARY KEY (ID, SURNAME);	DROP	Example 1(MySQL): Removes the defa value from the name column in the 'products' table.
	Adds, deletes or edits columns in a table.	DEFAULT	ALTER TABLE products
	It can also be used to add and delete constraints in a table, as per the above.		ALTER COLUMN name DROP DEFAUL
	Example: Adds a new boolean column called approved to a table named 'deals!		Deletes a table from a database.
ALTER TABLE	ALTER TABLE deals	DROP TABLE	Example: Removes the users table.
	ADD approved boolean;	IADLL	DROP TABLE users;
	Example 2: Deletes the approved column from the 'deals' table.	×	Checks for the existence of any record
	ALTER TABLE deals		within the subquery, returning true if one
	DROP COLUMN approved;		more records are returned.

Returns true # and the subquery values meet the passed condition. Example Returns the users with the highest number of tasks than the users with the highest number of tasks than the users with the highest number of tasks than the users with the highest number of tasks than the users with the highest number of tasks than the users with the highest number of tasks than the users with the highest number of tasks in the HIR. SELECT FROM seas, non-ALI (SELECT basks FROM seas, number). Where the stan, non-ALI (SELECT basks FROM seas, number). Where the stan, non-ALI (SELECT basks FROM seas, number). Where the stan, non-ALI (SELECT basks FROM seas, number). AND Uses to join separate conditions within a Where Cause. AND Example Returns events located in Lordon, Indeed Ringdom. AND SELECT FROM seas. Where the cause. SELECT FROM users. Where postured of the subquery values meet the please condition. Example Returns postucist from the products able which not person than in all as white which only exists for the duration of the subquery with only exists for the duration of the subquery with only exists for the duration of the subquery with only exists for the duration of the subquery with only exists for the duration of the subquery with only exists for the duration of the subquery with only exists for the duration of the subquery with only exists for the duration of the subquery with only exists for the duration of the subquery with only exists for the duration of the subquery with only exists for the duration of the subquery with only exists for the duration of the subgraph (FROM shock). ASC Example Agles, Bananse, Peaches, Raddish, White Required by Etrive Subgraph (FROM shock). SELECT FROM shock. Where Required by Etrive Subgraph (FROM shock) with a quantity between 10 and 150. Alternatively, using the NOT layered them were the subgraph of the subgraph (FROM shock). SELECT FROM shock. Where Required by Etrive Subgraph (FROM shock) with a quantity between 10 and 150. Alternatively, using the NOT lay	ALTER COLUMN	Changes the data type of a table's column. Example In the 'users' table, make the column 'incept_date' into a 'datetime' type. ALTER TABLE users ALTER COLUMN incept_date datetime;	EXISTS	finance percentage less than 10. SELECT dealership_name FROM dealerships WHERE EXISTS (SELECT deal_name FROM deals WHERE dealership_id =
ALL Specific Press Select State Select State		meet the passed condition.	*	14 888 Mill 5152 635 9669-11 525 Mil HAD 46
SELECT rest, name, sumame, tasks, no FROM SELECT area, "manager FROM area, managers WHERE department," of 2); WHERE department, of 2); WHERE department of multiple OR conditions on the condition of the condit	A11	number of tasks than the user with the highest number of tasks in the HR		from.
##ROM users WHERE tasks, no >ALL (SELECT tasks, FROM user VPHERE department_id = 2); ##ROM user VPHERE cause. ##ROM users ##ROM user	ALL	3 4 8	FROM	10
AND AND Land to join separate conditions within a WHERE clause. Example Returns reverts located in London, United Kingdom, AND Took, Christ Country "United Kingdom," AND Took, Christ Country "United Kingdom," AND Took, Chrys "London". Returns true if any of the subquery values meet the given condition. Example Returns products from the products table which have received orders - stored in the crisers table - with a quantity of more than 5. SELECT name Renames a table or column with an alias value which only exists for the duration of the query. Renames a table or column with an alias value which only exists for the duration of the query. AS AS AS As Like Throm users AS Like Throm were subscriptions As in e.g. subscriptions As in e.g. subscriptions column. ASC Lived with ORDER BY to return the data in ascending order: Example Apples. Brannas. Peaches. Readdin. ASC Like Throm were the country in the count			FROM	102-4-5 serves 55-5-11 18-04-5-10-5-10-5-10-10-10-10-10-10-10-10-10-10-10-10-10-
AND AND Example Returns events located in London, United Kingdom' SELECT "FROM werents WHERE cause, WHERE cause, SELECT "FROM users WHERE cause, SELECT "FRO				WHERE EXISTS (SELECT ProductName FROM Products WHERE area_manager_id = deals.area_manager_id AND Price < 20);
AND London, United Kingdom' AID host_clipt=London, WHERE host_country='United Kingdom' AID host_clipt=London, Returns true if any of the subquery values meet the given condition. Example Returns products from the products trom the products table which have received orders—softered in the orders table—with a quantity of more than 5. SELECT TEROM users WHERE productd = ANY (SELECT productd FROM orders with the products table or column with an alias value of the quarty.) Returns true if any of the subquery values meet the given condition. ANY INSERT INTO Returns true if any of the subquery values meet the given range. SELECT TEROM users WHERE productd = ANY (SELECT productd from the products from the products from the dual or column with an alias value of the quarty.) Example Aliases north, east_user_ subscriptions AS ne_subs. FROM users WHERE occurred the dual in ascending order. SELECT TEROM users WHERE contact_number is NULL IS NOT NULL IS NOT NULL The reverse of NULL Tests for value and the pattern. SELECT *FROM users WHERE contact_number is NULL Selects values within the given range. Example Alpels, Bananas, Peaches, Raddish. Selects values within the given range. Example 2 Selects slock with a quantity between 100 and 150. SELECT *FROM users WHERE first_name LIKE *Kson'. SELECT *FROM users NOT SELECT *FROM users WHERE first_name NOT LIKE iso WHERE first_name NOT LIKE iso OR Change query output depending on conditions. Example 1 Returns users and their subscriptions along with a new column called activity, levels that makes a more column cal				Used alongside a WHERE cause as a
SELECT* FROM sevents WHERE heat, countrys**United Kingdom* AND host_city***London**. Returns true if any of the subquery values meet the given condition. Example Returns true if any of the subquery values meet the given condition. Example Returns true if any of the subquery values meet the given condition. Example Returns true if any of the subquery values meet the given condition. Example Returns true if any of the subquery values meet the given condition. Example Returns true if any of the subquery values meet the given condition. Example Returns true if the orders table with a quantity meet and an ascending order. Example Apples, Bananas, Peaches, Raddish. ASC Example Apples, Bananas, Peaches, Raddish. Selects values within the given range. Example 2 Selects stock with a quantity between 100 and 150. Alternatively, using the NOT keyword here reverses the logic and selects values outside the given range. Example 2 Selects values used the given range. Example 2 Selects values used the given range. Example 100 and 150. Alternatively, using the NOT keyword here reverses the logic and selects values outside the given range. Example 150 and 150. Alternatively, using the NOT keyword here reverses the logic and selects values outside the given range. Example 150 and 150. Alternatively, using the NOT keyword here reverses the logic and selects values outside the given range. Example 150 and 150. Alternatively. Using the NOT keyword here reverses the logic and selects values outside the given range. Example 150 and 150. Alternatively. Using the NOT keyword here reverses the logic and selects values outside the given range. Example 150 and 150. Alternatively. Using the NOT keyword here reverses the logic and selects values outside the given range. Example 150 and 150. Alternatively. In the condition is true. Example 150 and 150. Alternatively. In the condition is true. Example 150 and 150. Alternatively. In the condition is true. Example 150 and 150. Alternatively. In the condition is true. Ex				shorthand for multiple OR conditions. So instead of:
WHERE host_country="United Kingdom" AND host_city*London"; AND host_city*London"; Returns true if any of the subquery values meet the given condition. Example Returns products from the products table which have received with a quantity of more than 5. SELECT name Renames a table or column with an alias value which only exists for the duration of the query. Example Aliases north_east_user_subscriptions AS ne_subs FROM users WHERE ne_subs > 5; IS NOT NULL IS NOT NULL Returns true if the user's SELECT * FROM users WHERE contact_number IS NULL SELECT north_east_user_subscriptions AS ne_subs FROM users WHERE ne_subs > 5; IS NOT NULL Returns true if the user's subscriptions AS ne_subs Example Apples, Bananas, Peaches, Raddish. ASC Example Apples, Bananas, Peaches, Raddish NOT SELECT * FROM users WHERE ne_subs > 5; IS NOT NULL Returns true if the user's subscriptions as seeding order. Example Apples, Bananas, Peaches, Raddish NOT SELECT * FROM users WHERE ne_subs > 6; IS NOT NULL Returns true if the user's subscriptions as the user subscriptions are subscriptions and 150. SELECT * FROM subscriptions are subscriptions and 150. Example Returns true if the user's subscriptions and 150. SELECT * FROM subscriptions are subscriptions are subscriptions are subscriptions. SELECT * FROM subscriptions are subscriptions. ASC Example 2 Selects subscriptions are subscriptions. ASC Example 2 Selects subscriptions are subscriptions. Selects values within the given range. Example Returns true if the user's subscriptions and 150. Example Returns true if the user's subscriptions are subscriptions are subscriptions. ASC SELECT * FROM subscriptions are subscriptions. ASC Selects values within the given range. Example Returns true if the user's subscriptions are subscriptions. ASC SELECT * FROM	AND	control and the supervision of t		SELECT * FROM users
Returns true if any of the subquery values meet the given condition. Example Returns products from the products from the products table which have received orders – stored in the orders able – with a quantity of more than 5. SELECT reme Renames a table or column with an alias value which only exists for the duration of the query. Example Aliases north, east_user_ subscriptions AS ne_gubs FROM users WHERE ne_subs > 5, Used with ORDER BY to return the data in ascending order. Example Apples, Bananas, Peaches, Raddath. ASC Between 100 and 150. Alternatively, using the NOT keyword to load 150. Alternatively, using the NOT keyword toll and 150. Alternatively, using the NOT keyword the reverses the logic and select values output a new column called activity_levels that makes a forter of refer the subscriptions, along with a new column called activity_levels that makes a more conditions. Evample 1.Returns users and their subscriptions, along with a new column called activity_levels that makes an order of refer the result data in ascet (defaulty or descending or conditions.) Evample 1.Returns users and their subscriptions, along with a new column called activity_levels that makes an order. Evample 1.Returns users and their subscriptions, along with a new column called activity_levels that makes an order. Evample 1.Returns users and their subscriptions, along with a new column called activity_levels that makes an order. Evample 1.Returns users and their subscriptions, along with a new column called activity_levels that makes an order. Evample 2.Returns true if the user first_name called activity_levels that makes an order. Evample 2.Selects such with a quantity or descending order. Evample 2.Selects such with a new column called activity_levels that makes an order. Evample 2.Selects such with a new column called activity_levels that makes an order.		2661 - F. 2002 A-2147 P. C. C. (2002 A-1640 A-1440 A-1400 A-1400 A-1400 A-1400 A-1400 A-1400 A-1400 A-1400 A		WHERE country = 'USA' OR country = 'United Kingdom' OR
Returns true if any of the subpuery values meet the given condition. Example Returns products from the products table which have neceived orders — solved in the orders table — with a quantity of more than 5. SELECT name Renames a table or column with an alias value which not peasing to the query. Renames a table or column with an alias value which not peasing to the query. Example Adds a new vehicle. INSERT INTO INSERT INTO INSERT INTO INSERT INTO Add mer rows to a table. Example Adds a new vehicle. INSERT INTO INSERT INTO INSERT INTO INSERT INTO Add mer rows to a table. Example Adds a new vehicle. INSERT INTO INSERT INTO INSERT INTO INSERT INTO Add mer rows to a table. Example Adds a new vehicle. INSERT INTO INSER INTO INSERT INTO INSERT INTO INSERT INTO INSERT INTO INSER INTO INSERT INTO INSERT INTO INSERT INTO INSERT INTO INSER INTO INSERT INTO INSERT INTO INSERT INTO INSERT INTO INSER INTO INSERT INTO INSERT INTO INSERT INTO INSERT INTO INSER			IN	country = 'Russia' OR country = 'Australia';
### ANY Sample Returns products from the products from the products fails which have received orders - stored in the orders table - with a quantity of more than 5. SELECT name				You can use:-
ANY Example Returns products that which have received orders – stored in the orders table – with a quantity of more than 5. SELECT name FROM products Renames a table or column with an alias value which only exists for the duration of the query. Example Aliases north_east_user_ subscriptions AS ne_gubs FROM users WHERE en_gubs > 5; Used with ORDER BY to return the data in ascending order. Example Aliases stock with a quantity of where no down the given range. Example Aliases to the data in ascending order. Example Aliases to the with a quantity between 100 and 150. Selects values within the given range. Example Aliases to the with a quantity between 100 and 150. Selects values within the given range. Example 2 Selects stock with a quantity between 100 and 150. Select *FROM stock WHERE quantity BETWEEN 100 AND 150; Example 2 Selects stock with a quantity hord between 100 and 150. Alternatively, using the NOT keyword here reverses the logic and selects values outside the given range. Select *FROM stock WHERE quantity NOT BETWEEN 100 AND 150: Change query output depending on conditions, along with a new column called activity, Levels that makes a contact and recondition is true. Example 1 Returns users and their subscriptions, along with a new column and activity, Levels that makes a contact and reconditions is not provided activity, Levels that makes a contact and reconditions is true. Example Returns countries in alignment and their subscriptions, along with a new column called activity, Levels that makes a contact and reconditions is true. Example Returns countries in alignment and reconditions is true. Example Returns countries in alignment and reconditions is true. Example Returns true if the us				2002/004/400e/00405 Vi 2003/004/2004/004/004/004/004/004/
ANY with a quantity of more than 5. SELECT name FROM products WHERE producted = ANY (SELECT productid = ANY (SELECT productid = ANY (SELECT productid = ANY (SELECT productid FROM orders WHERE Qty > Renames a table or column with an alias value which only exists for the duration of the query. Example Aliases north_east_user_subscriptions. AS ne_subs. FROM users WHERE ne_subs > 5; Used with ORDER BY to return the data in ascending order. Example Apples, Bananas, Peaches, Raddish. Selects values within the given range. Example Apples, Bananas, Peaches, Raddish. Select **FROM** Select** Select*		products table which have received	8	
SELECT name INSERT INTO	ANY			Add new rows to a table.
### ROM products WHERE productid = ANY (SELECT productid FROM orders WHERE City > Renames a table or column with an alias value which only exists for the duration of the query. Example Risases north_east_user_subscriptions AS ne_subs FROM users WHERE ne_subs > 5; Used with ORDER BY to return the data in ascending order. Example: Returns true if the operand valuer pattern. Selects values within the given range. Example: Returns true if the user first_name click "son"; Select "FROM users WHERE first_name and title "son"; Select "FROM users WHERE first_name LIKE "son"; Select "FROM users WHERE first_name and title "son"; Select "FROM users WHERE first_name and title "son"; Select "FROM users WHERE first_name and title "son"; Select "FROM users WHERE first_name of the user first_name click "son"; Select "FROM users WHERE first_name NOT LIKE "son "son"; WHERE first_name NOT LIKE "son "son"; Select "FROM users WHERE first_name NOT LIKE "son "son"; WHERE first_name NOT LIKE "son "son"; Select "FROM users WHERE first_name NOT LIKE "son "son"; WHERE first_name NOT LIKE "son "son"; WHERE first_name NOT LIKE "son "son"; Select "FROM users WHERE first_name NOT LIKE "son "son"; WHERE		SELECT name	INSERT INTO	Example: Adds a new vehicle.
Renames a table or column with an alias value which only exists for the duration of the query. Example Aliases north, east_user_ subscriptions A5 ne_gubs FROM users WHERE ne_subs > 5; Used with ORDER BY to return the data in ascending order. Example Apples, Bananas, Peaches, Raddish. BETWEEN BETWEEN Relations to the given range. Example Selects stock with a quantity between 100 and 150. WHERE quantity BETWEEN 100 and 150. Alternatively using the NOT between 100 and 150. Alternatively using the NOT between 100 and 150. WHERE given range. SELECT * FROM stock WHERE quantity BETWEEN 100 AND 150; Example 2. Selects stock with a quantity between 400 and 150. Alternatively using the NOT between 100 and 150. Alt		WHERE productId = ANY (SELECT	INOLKI INIO	INSERT INTO cars (make, model, mileage, year) VALUES ('Audi', 'A3', 30000, 2016);
AS Value which only exists for the duration of the query.		productid FROM orders WHERE Qty >		Tests for empty (NULL) values.
AS Example Aliases north_east_user_subscriptions AS ne_subscriptions column. SELECT north_east_user_subscriptions AS ne_subs FROM users WHERE ne_subs > 5; Used with ORDER BY to return the data in ascending order. Example Apples, Bananas, Peaches, Raddish. Selects values within the given range. Example 1:Selects stock with a quantity between 100 and 150. SELECT * FROM stock WHERE inst_name clike "son". SELECT * FROM users WHERE first_name Like "soon". SELECT * FROM users WHERE first_name like "soon". SELECT * FROM users WHERE first_name clike "soon". SELECT * FROM users WHERE first_name obesn't end with 'son'. Alternatively, using the NOT keyword here reverses the logic and selects values outside the given when either condition is true. Example: Returns users that live is SelecT * FROM users WHERE city = 'Sheffield' OR 'Man Used to sort the result data in asce (default) or descending order through use of ASC or DESC keywords. Example: Returns countries in alporder. ORDER BY Used alongside WHERE to include when either condition is true. Example: Returns users that live is Sheffield or Manchester. SELECT * FROM users WHERE city = 'Sheffield' OR 'Man Used to sort the result data in asce (default) or descending order through use of ASC or DESC keywords. Example: Returns countries in alporder.		THE SALE OF THE SA		WHERE first_name NOT LIKE 'son';
Tange. SELECT * FROM stock WHERE quantity NOT BETWEEN 100 AND 150; Change query output depending on conditions. Example: Returns users that live is Sheffield or Manchester. SELECT * FROM users WHERE city = 'Sheffield' OR 'Man Used to sort the result data in asce (default) or descending order through use of ASC or DESC keywords. Example: Returns users that live is Sheffield or Manchester. SELECT * FROM users WHERE city = 'Sheffield' OR 'Man Used to sort the result data in asce (default) or descending order through use of ASC or DESC keywords. Example: Returns countries in alporter.	BETWEEN	NOT between 100 and 150. Alternatively, using the NOT keyword here reverses the	8	Used alongside WHERE to include data
SELECT * FROM stock WHERE quantity NOT BETWEEN 100 AND 150; Change query output depending on conditions. Example 1:Returns users and their subscriptions, along with a new column called activity_levels that makes a OR Sheffield or Manchester. SELECT * FROM users WHERE city = 'Sheffield' OR 'Man Used to sort the result data in asce (default) or descending order through use of ASC or DESC keywords. Example: Returns countries in alporter. ORDER BY				
Change query output depending on conditions. Example 1: Returns users and their subscriptions, along with a new column called activity_levels that makes a WHERE city = 'Sheffield' OR 'Man Used to sort the result data in asce (default) or descending order through use of ASC or DESC keywords. Example: Returns countries in alporter.		SELECT * FROM stock	OR	
conditions. Example 1:Returns users and their subscriptions, along with a new column called activity_levels that makes a Conditions. (default) or descending order through use of ASC or DESC keywords. Example: Returns countries in alporter.		P 10 10 10 10 10 10 10 10 10 10 10 10 10		SELECT * FROM users WHERE city = 'Sheffield' OR 'Manchester';
conditions. Example 1:Returns users and their subscriptions, along with a new column called activity_levels that makes a (default) or descending order throu use of ASC or DESC keywords. Example: Returns countries in alporter.		NEAR SOURCE SEASON CONTRACTOR AND	<u>-</u>	Used to sort the result data in ascending
subscriptions, along with a new column called activity_levels that makes a ORDER BY Example: Returns countries in alp		STATE AND STATES STATES		(default) or descending order through the
		subscriptions, along with a new column	ORDER BY	Example: Returns countries in alphabetical
judgement based on the number of subscriptions. SELECT * FROM countries		judgement based on the number of		
SELECT FROM countries SELECT first_name, surname, subscriptions ORDER BY name;		SELECT first_name, surname,		TO SEE SHOW THE SOURCE AND
CASE	CASE			Returns results where the row number

	WHEN Quantity BETWEEN 3 AND 10 THEN 'Active' ELSE 'Inactive' END AS activity levels	ROWNUM	Example: Returns the top 10 countries from the countries table. SELECT * FROM countries WHERE ROWNUM C= 10;
	Adds a constraint that limits the value which can be added to a column. Example 1(MySQL): Makes sure any users added to the users table are 18 or over. CREATE TABLE users first_name varchar(255),	SELECT	Used to select data from a database, which is then returned in a results set. Example: Selects all columns from all users. SELECT * FROM users; Example 2: Selects the first_name and surname columns from all users.XX SELECT first_name, surname FROM users.
CHECK	age int, CHECK (age=18)); Example 2(MySQL): Adds a check after the table has already been created. ALTER TABLE users ALTER TABLE users	SELECT DISTINCT	Sames as SELECT, except duplicate value are excluded. Example: Creates a backup table using data from the users table. SELECT * INTO usersBackup2020 FROM users;
CREATE DATABASE	Creates a new database. Example 1(MySQL): Creates a new database named websiteset. CREATE DATABASE websitesetup;	SELECT INTO	Copies data from one table and inserts it into another. Example: Returns all countries from the users table, removing any duplicate values (which would be highly likely). SELECT DISTINCT country from users;
CREATE	Creates a new table. Example: Creates a new table called 'users' in the websitesetup database. CREATE TABLE users id int,	SELECT TOP	Allows you to return a set number of records to return from a table. Example: Returns the top 3 cars from the cars table. SELECT TOP 3 * FROM cars;
first_name varchar(255), surname varchar(255), address varchar(255), contact number int);	surname varchar(255), address varchar(255), contact number int	SET	Used alongside UPDATE to update existin data in a table. Example: Updates the value and quantity values for an order with an id of 642 in the orders table. UPDATE orders
	Sets a default value for a column; Example 1(MySQL): Creates a new table called Products which has a name column with a default value of 'Placeholder Name'	SOME	SET value = 19.49, quantity = 2 WHERE id = 642; Identical to ANY
DEFAULT	and an available_from column with a default value of today's date. CREATE TABLE products id int, name varchar(255) DEFAULT 'Placeholder Name', available from date DEFAULT GETDATE()	ТОР	Used alongside SELECT to return a set number of records from a table. Example: Returns the top 5 users from the users table. SELECT TOP 5 * FROM users;
); Example 2(MySQL): The same as above, but editing an existing table. ALTER TABLE products ALTER name SET DEFAULT 'Placeholder Name' ALTER available_from SET DEFAULT	TRUNCATE TABLE	Similar to DROP, but instead of deleting th table and its data, this deletes only the dat Example: Empties the sessions table, but leaves the table itself intact. TRUNCATE TABLE sessions;
DELETE	Delete data from a table. Example: Removes a user with a user_id of 674. DELETE FROM users WHERE user_id = 674;	UNION	Combines the results from 2 or more SELECT statements and returns only distinct values. Example: Returns the cities from the even and subscribers tables. SELECT city FROM events UNION
DESC	Used with ORDER BY to return the data in descending order. Example: Raddish, Peaches, Bananas, Apples.	UNION ALL	SELECT city from subscribers; The same as UNION but includes duplicat values.
			This constraint ensures all values in a column are unique. Example 1 (MySQL): Adds a unique constraint to the id column when creating a new users table. CREATE TABLE users

id int NOT NULL.

UNIQUE	name varchar(255) NOT NULL,
2004/06/04/05/4/05	W W 60 60 K
	UNIQUE (id)
);
	Example 2 (MySQL): Alters an existing column to add a UNIQUE constraint.
	ALTER TABLE users
	ADD UNIQUE (id);
	Updates existing data in a table.
	Example: Updates the mileage and service Due values for a vehicle with an
UPDATE	UPDATE cars
	SET mileage = 23500, serviceDue = 8
	WHERE id = 45;
	Used alongside the INSERT INTO keyword to add new values to a table.
	Example: Adds a new car to the cars table
VALUES	SET mileage = 23500, serviceDue = 8
	INSERT INTO cars (name, model, year)
	VALUES ('Ford', 'Fiesta', 2010);
WHERE	Filters results to only include data which meets the given condition.
	Example : Returns orders with a quantity of more than 1 item.
	SELECT * FROM orders
	WHERE quantity > 1;

COMMENTS

SINGLE LINE COMMENTS

Single line comments start with -. Any text after these 2 characters to the end of the line will be ignored

-- My Select query

SELECT * FROM users;

MULTILINE COMMENTS

Multiline comments start with /* and end with */. They stretch across multiple lines until the closing characters have been found.

/*

This is my select query.

It grabs all rows of data from the users table

SELECT * FROM users;

This is another select query, which I don't want to execute yet

SELECT * FROM tasks;

*/

MySQL Data Types

CREATE TABLE users (

id int,

first_name varchar(255)

);

STRING DATA TYPES

DATA TYPE DESCRIPTION

CHAR(SIZE)

Fixed length string which can contain letters, numbers and special characters. The size parameter sets the maximum string length, from 2, 255 with a default

NUMERIC DATA TYPES

DATA TYPE DESCRIPTION

BIT(SIZE)

A bit-value type with a default of 1. The allowed number of bits in a value is set via the size parameter, which can hold values

	of 1.
VARCHAR(SIZE)	Variable length string similar to CHARQ, but with a maximum string length range from 0 to 65535.
BINARY(SIZE)	Similar to CHARO but stores binary byte strings.
VARCHAR(SIZE)	Similar to CHARO but stores binary byte strings.
TINYBLOB	Holds Binary Large Objects (BLOBs) with a maxlength of 255 bytes.
TINYTEXT	Holds a string with a maximum length of 255 characters. Use VARCHAR() instead, as it's fetched much faster.
TEXT(size)	Holds a string with a maximum length of 65535 bytes. Again, better to use VARCHARO
BLOB(size)	Holds Binary Large Objects (BLOBS) with a max length of 65535 bytes.
MEDIUMBLOB	Holds Binary Large Objects (BLOBs) with a max length of 16,777,215 bytes
LONGTEXT	Holds a string with a maximum length of 4,294,967,295 characters.
LONGBLOB	Holds Binary Large Objects (BLOBS) with a max length of 4,294,967,295 bytes
ENUM(a, b, c, etc)	A string object that only has one value, which is chosen from a list of values which you define, up to a maximum of 65535 values. If a value is added which isn't on this list, it's replaced with a blank value instead. Think of ENUM being similar to HTML radio boxes in this regard. CREATE TABLE tshirts (color ENUM 'red', 'green', 'blue', 'yellow', 'purple'));
SET (a, b, c, etc)	A string object that can have 0 or more values, which is chosen from a list of values which you define, up to a maximum of 64 values. Think of SET being similar to HTML checkboxes in this regard

DATE/TIME DATA TYPES		
DATA TYPE	DESCRIPTION	
DATE	A simple date in YYYY-MM-DD format, with a supported range from "1000-01-01' to '9999-12-31.	
DATETIME(fsp)	A date time in YYYY-MM-DD hh:mmess format, with a supported range from '1000-01-01 00:00:00' to '9999-12-31 23:59:59'.' By adding DEFAULT and ON UPDATE to the column definition, it automatically sets to the current date/time.	
TIMESTAMP(fsp)	A Unix Timestamp, which is a value relative to the number of seconds since the Unix epoch (1970-01-01 00:00:00' UTC). This has a supported range from '1970-01-01 00:00:01 UTC to 2038-01-09 03:14:07' UTC	
	By adding DEFAULT CURRENT_TIMESTAMP and ON UPDATE CURRENT TIMESTAMP to the column definition, it automatically sets to current date/time.	
TIME(fsp)	A time in hh:mmess format, with a supported range from '838:59:59 to '838:59:59.	

	HOIII to 04.		
TINYINT(SIZE)	A very small integer with a signed range of -128 to 127, and an unsigned range of 0 to 255. Here, the size parameter specifies the maximum allowed display width, which is 255.		
BOOLEAN	Same as BOOL		
SMALLINT(size)	A small integer with a signed range of -32768 to 32767, and an unsigned range from 0 to 65535. Here, the size parameter specifies the maximum allowed display width, which is 255.		
MEDIUMINT(size)	A medium integer with a signed range of -8388608 to 8388607, and an unsigned range from 0 to 16777215. Here, the size parameter specifies the maximum allowed display width, which is 255.		
INT(size)	A medium integer with a signed range of -2147483648 to 2147483647, and an unsigned range from 0 to 4294967295. Here, the size parameter specifies the maximum allowed display width, which is 255.		
INTEGER(size)	Same as INT.		
BIGINT(size)	A medium integer with a signed range of -9223372036854775808 to 9223372036854775807, and an unsigned range from 0 to18446744073709551615. Here, the size parameter specifies the maximum allowed display width, which is 255.		
FLOAT(p)	A floating point number value. If the precision (p) parameter is between O to 24, then the data type is set to FLOAT(), whilst if its from 25 to 53,the data type is set to DOUBLE(). This behaviour is to make the storage of values more efficient.		
DOUBLE(size, d)	A floating point number value where the total digits are set by the size parameter, and the number of digits after the decimal point is set by the d parameter		
DECIMAL(size, d)	An exact fixed point number where the total number of digits is set by the size parameters, and the total number of digits after the decimal point is set by the d parameter. For size, the maximum number is 65 and the default is 10, whilst ford, the maximum number is 30 and the default is 10.		
DEC(sze, d)	Same as DECIMAL.		
	k		

OPERATORS

ARITHMETIC OPERATORS	
OPERATOR	DESCRIPTION
+	Add
(2 0	Subtract
*	Multiply
1	Divide
%	Modulo

*=	Multiply equals	
<i>[</i> =	Divide equals	
%=	Modulo equals	
&=	Bitwise AND equals	
^=	Bitwise exclusive equals	
I*=	Bitwise OR equals	

FUNCTIONS

STRING FUNCTIONS		
DATA TYPE DESCRIPTION		
ASCIIA	Retums the equivalent ASCII value for a specific character.	
CHAR_LENGTH	Returns the character length of a string.	
CHARACTER LENGTH	Same as CHAR_LENGTH.	
CONCAT	Adds expressions together, with a minimum of 2.	
CONCAT_WS	Adds expressions together, but with a separator between each value.	
	Retums an index value relative to the	

NUMERIC FUNCTIONS			
DATA TYPE	DESCRIPTION		
ABS	Returns the absolute value of the given number.		
ACOS	Returns the arc cosine of the given number		
ASIN	Returns the arc sine of the given number.		
ATAN	Returns the arc tangent of one or 2 given numbers		
ATAN2	Return the arc tangent of 2 given numbers.		
WAY/G	Returns the average value of the given		

FIELD	position of a value within a list of values.		expression.
FORMAT	When passed a number, returns that number formatted to include commas (eg 3,400,000).	CEIL	Returns the closest whole number (intege upwards from a given decimal point numb
INSERT	Allows you to insert one string into another at a certain point, for a certain number of characters.	CEILING	Same as CEIL
	Returns the position of the first time one	cos	Returns the cosine of a given number.
INSTR	string appears within another.	сот	Retums the cotangent of a given number.
LCASE	Convert a string to lowercase.	COUNT	Returns the amount of records that are returned by a SELECT query.
LEFT	Starting from the left, extract the given number of characters from a string and return them as another.	DEGREES	Converts a radians value to degrees.
LENGTH	Returns the length of a string, but in bytes.	DIV	Allows you to divide integers.
LOCATE	Returns the first occurrence of one string within another,	EXP	Returns to the power of the given number
LOWER	Same as LCASE	FLOOR	Returns the closest whole number (intege downwards from a given decimal point number.
LPAD	Left pads one string with another, to a specific length.	GREATEST	Returns the highest value in a list of arguments.
LTRIM	Remove any leading spaces from the given string.	LEAST	Returns the smallest value in a list of arguments.
MID	Extracts one string from another, starting from any position.	LN	Retums the natural logarithm of the given number.
POSITION	Returns the position of the first time one substring appears within another.	LOG	Returns the natural logarithm of the given number, or the logarithm of the given num
REPEAT	Allows you to repeat a string.		to the given base.
REPLACE	Allows you to replace any instances of a substring within a string, with a new substring.	LOG10	Does the same as LOG, but to base 10
REVERSE	Reverses the string.	LOG2	Does the same as LOG, but to base 2.
	Starting from the right, extract the given	MAX	Returns the highest value from a set of values.
RIGHT	number of characters from a string and return them as another.	MIN	Returns the lowest value from a set of values.
RPAD	Right pads one string with another, to a specific length.	MOD	Returns the remainder of the given number divided by the other given number.
RTRIM	Removes any trailing spaces from the given string.	PI	Returns PI.
SPACE	Returns a string full of spaces equal to the amount you pass it.	POW	Returns the value of the given number
STRCMP	Compares 2 strings for differences.	POW	raised to the power of the other given number.
SUBSTR	Extracts one substring from another, starting	POWER	Same as POW.
	from any position.	RADIANS	Converts a degrees value to radians.
SUBSTRING	Same as SUBSTR	RAND	Returns a random number.
SUBSTRING_ INDEX	Returns a substring from a string before the passed substring is found the number of	SIGN	Returns the sign of the given number.
INDEX.	times equals to the passed number.	SIN	Returns the sine of the given number.
TRIM	Removes trailing and leading spaces from the given string Same as if you were to run LTRIM and RTRIM together.	SQRT	Returns the square root of the given number.
UCASE	Convert a string to uppercase.	SUM	Returns the value of the given set of value combined.
UCASE	Convert a suring to uppercase.	TAN	Returns the tangent of the given number.

- 1	ш	D	D	_	D
- 1		_	_		м

Same as UCASE.

TRUNCATE	Returns number truncated to the given number of decimal places.

NUME	RIC FUNCTIONS
DATA TYPE	DESCRIPTION
ADDDATE	Add a date interval (eg 10 DAY) to a date (eg 20/01/20) and return the result (eg: 20/01/30).
ADDTIME	Add a time interval (eg: 02:00) to a time or datetime (05:00) and return the result (07:00).
CURDATE	Get the current date.
CURRENT_DATE	Same as CURDATE.
CURRENT_ TIMESTAMP	Get the current date and time.
CURTIME	Same as CURRENT_TIME.
DATE	Extracts the date from a datetime expression.
DATEDIFF	Returns the number of days between the 2 given dates.
DATE_ADD	Same as ADDDATE.
DATE_FORMAT	Formats the date to the given pattern.
DATE_SUB	Subtract a date interval (eg: 10 DAY) to a date (eg 20/01/20) and return the result (eg: 20/01/10).
DAY	Returns the day for the given date.
DAYNAME	Returns the weekday name for the given date.
DAYOFWEEK	Returns the index for the weekday for the given date.
DAYOFYEAR	Returns the day of the year for the given date.
EXTRACT	Extract from the date the given part (eg MONTH for 20/01/20=01).
FROM DAYS	Return the date from the given numeric date value. HOUR.
HOUR	Return the hour from the given date.
LAST DAY	Get the last day of the month for the given date.
LOCALTIME	Gets the current local date and time.
LOCALTIMESTAMP	Same as LOCALTIME.
MAKEDATE	Creates a date and returns it, based on the given year and number of days values.
MICROSECOND	Returns the microsecond of a given time or datetime.
MINUTE	Returns the minute of the given time or datetime.

NUMERIC FUNCTIONS				
DATA TYPE	DESCRIPTION			
IN	Returns the given number in binary.			
BINARY	Returns the given value as a binary string			
CAST	Convert one type into another.			
COALESCE	From a list of values, return the first non-null value.			
CONNECTION_ID	For the current connection, return the unique connection ID.			
CONV	Convert the given number from one numeric base system into another.			
CONVERT	Convert the given value into the given datatype or character set.			
CURRENT_USER	Return the user and hostname which was used to authenticate with the server.			
DATABASE	Get the name of the current database.			
	Used alongside aggregate functions (COUNT, MAX, MIN, SUM, AVG) to group the results.			
GROUP BY	Example: Lists the number of users with active orders.			
	SELECT COUNT(user_id), active_orders			
	FROM users GROUP BY active_orders;			
	It's used in the place of WHERE with			
	aggregate functions.			
HAVING	Example : Lists the number of users with active orders, but only include users with more than 3 active orders.			
	SELECT COUNT(user_id), active_orders			
	FROM users			
	GROUP BY active_orders HAVING COUNT(user_id) > 3;			
	TIAVING GOONT (user_id) > 3,			
IF	If the condition is true return a value, otherwise return another value.			
IFNULL	If the expression is null, return 1 otherwise return O.			
LAST_INSERT_ID	For the last row which was added or updated in a table, return the auto increment.			
NULLIF	Compares the 2 given expressions. If they are equal, NULL is returned, otherwise the first expression is returned.			
SESSION_USER	Return the current user and hostnames.			
SYSTEM_USER	Same as SESSION_USER.			
VERSION	Returns the current version of the MySQL powering the database.			

MONTH	Returns the month of the given date.
MONTHNAME	Returns the name of the month of the given date.
NOW	Same as LOCALTIME.
PERIOD_ADD	Adds the given number of months to the given period.
PERIOD_DIFF	Returns the difference between 2 given periods.
QUARTER	Returns the year quarter for the given date.
SECOND	Returns the second of a given time or datetime.
SEC_TO_TIME	Returns a time based on the given seconds.
STR_TO_DATE	Creates a date and returns it based on the given string and format.
SUBDATE	Same as DATE_SUB.
SUBTIME	Subtracts a time interval (eg: 02:00) to a time or datetime (05:00) and return the result (03:00).
SYSDATE	Same as LOCALTIME.
TIME	Returns the time from a given time or datetime.
TIME_FORMAT	Returns the given time in the given format.
TIME_TO_SEC	Converts and returns a time into seconds.
TIMEDIFF	Returns the difference between 2 given time/datetime expressions.
TIMESTAMP	Returns the datetime value of the given date or datetime.
TO_DAYS	Returns the total number of days that have passed from '00-00- 0000' to the given date.
WEEK	Returns the week number for the given date
WEEKDAY	Returns the weekday number for the given date.
WEEKOFYEAR	Returns the week number for the given date
YEAR	Returns the year from the given date.
YEARWEEK	Returns the year and week number for the given date.

WILDCARDS		
NAME	DESCRIPTION	
%	Equates to zero or more characters. Example 1: Find all users with surnames ending in 'son'. SELECT * FROM users WHERE surname LIKE 'xson'; Example 2: Find all users with surnames ending in 'son'.	
	SELECT * FROM users WHERE city LIKE '%che%';	
	Equates to any single character. Example 1: Find all users living in cities beginning with any 3 characters, followedby 'chester! SELECT * FROM users WHERE city LIKE 'chester'	
(CHADIST)	Equates to any single character in the list. Example 1: Find all users with first names beginning with J, H or M. SELECT * FROM users WHERE first_name LIKE '(jhm]>'; Example 2: Find all users with first names beginning letters between A-L. SELECT * FROM users WHERE first_name LIKE '[a-1]>'; Example 3: Find all users with first names not ending with letters between n-s. SELECT * FROM users WHERE first_name LIKE '%[!n-s]);

What is a Database?

Before we get started with SQL Cheat Sheet, we need to understand what is a database and why do we need SQL. If you want to learn this offline, you can download the SQL basics cheat sheet any time.

Data is a collection of facts related to any object. For example: - Your name, number, birthday, phone number, email address, etc. is a collection of facts about you.

Therefore, a database is a systematic collection of small units of information (data). For example: - An organized list of all the students of a school along with their data (Name, Phone Number, Birthday, etc.) is referred to as a database.

What is an RDBMS(Relational Database Management System)?

RDBMS Stands for Relational DataBase Management System and is a collection of tools that allow users to organize, manipulate, and visualize databases. RDMBS follows some standards that allow for the fastest response from a database and make it easier for humans to interact with a database.

Think of an RDBMS as a tool that allows you to play with your data and generate insights or value from the database.

What is SQL(Structured Query Language)?

Now that you understand what a database is and what a DBMS is, let's understand what SQL is.

To recap, a database is a collection of data and an RDBMS is a tool that allows you to interact with your data. Therefore, you would need a "language" to communicate with the database that humans and computers can understand, and that language is known as SQL.

SQL stands for Structured Query Language. As the name suggests, it is a structured language via which you can query the database for performing various tasks such as Storing, Manipulating, and <u>retrieving data from a database</u>.

SQL is the standard language when it comes to communicating with powerful relational databases such as Oracle, Sybase, Microsoft SQL Server, Access, Ingres, etc. Anything related to data in relational databases such as creating tables, limiting access to data, sorting, filtering, grouping, etc. is achieved using SQL.

In this SQL cheatsheet, we will be learning everything there is to learn about SQL.

SQL v/s MySQL: Difference Between Both

Most beginners usually get confused between the two terms - SQL and MySQL, and sometimes use the two interchangeably. However, there is a clear and vast difference between the

As defined earlier, SQL is a language that allows one to communicate with the database. MySQL on the other hand is an RDBMS in which you can type SQL commands to interact with the database.

SQL is the language/protocol that is used by relational database management systems to allow users to manipulate data in the database.

MySQL is a database management system that provides users with an interface to connect with databases. MySQL provides users with the ability to create various databases, tables, stored procedures, functions in their database servers. SQL is the language that is used to perform powerful operations on the database.

In this SQL Cheat Sheet, we would be looking at both SQL and MySQL which would help clarify the difference.

What Can SQL do?

SQL is a powerful programming language that allows you to communicate with the database. Almost all companies use databases to store and retrieve data in some form or the other.

Using SQL, you create Databases, and inside a database, you create various TABLES in which you can add all your data. Using SQL, you can:

- 1. Create / Delete Databases
- 2. Create / Delete Table(s) in a database
- 3. **SELECT** particular data from table(s)
- 4. INSERT data into tables
- 5. **UPDATE** data in tables
- 6. **DELETE** data from tables
- 7. Create Views in the database
- 8. Execute various aggregate functions

and tons of other cool stuff. So, let's see how we can harness this power.

How to get started with SQL?

To get started with writing SQL on your computer, you would need to install a Database Management Server. The RDBMS would then give you all the necessary tools to interact with your database.

There are various RDBMS that you can use, and it doesn't matter (much) what system you choose as long as it's working for you. Some of the most common RDBMS are:

- 1. MySOL
- 2. Oracle
- 3. Microsoft SQL Server
- 4. PostgreSQL
- 5. Heidi SQL

Just install any of the RDBMS that you like from their official website and you should be able to create a database server by simply following their instructions. Once you have a database server ready, you can get access to a Query Editor where you can type all your SQL queries.

Now, let's get started with our cheat sheet and learn some SQL basics and SQL syntax to get the ball rolling.

Working with Tables

To work with SQL, you need to understand that data is organized into tables. One database would contain all the data for a single application (in most cases). A single database would have multiple tables that store values.

For example:- If you have a restaurant management application or implemented E-Delivery solution for smooth operations, you would have a database that contains tables such as:

- 1. Customers
- 2. Orders
- 3. Menu Items
- 4. Receipts
- 5. Combox

etc. Each table would contain a specific type of data and various tables could have different types of relations. Using SQL relations, we can combine values from different tables to fetch the data that we require. (More on relations in a later section)

To create a table, we would require two things. Firstly, we would need all the fields that we want to store in a table. Secondly, we want to define the type of data that would enter into a table.

Let's take the restaurant management application's Customers table as an example. We want to store some information about <u>each of our customers</u> such as their name, Phone Number, and Postal Code. Now that we are done with the first step, we need to define the data types of these values.

The name of a customer would be of character data type because we need to store alphabetical characters. Similarly, the phone number would be characters again because we would need to store country code, and special characters such as '+', '()', etc. The postal code would be of type integer because we need to store numbers. Here is how the table would look like:

Name Phone Postal Code varchar(50) varchar(15) integer

To identify each customer uniquely, we add an ID to them so that we can use this ID to connect data from various tables. So, the final table structure could look something like this.

ID Name Phone Postal Code INTEGER VARCHAR(50) VARCHAR(15) INTEGER

To create this table, we would use the CREATE SQL Command followed by the fields as follows:

CREATE TABLE customers(

ID INT NOT NULL,

name varchar(50), phone varchar(15),

postalCode INT

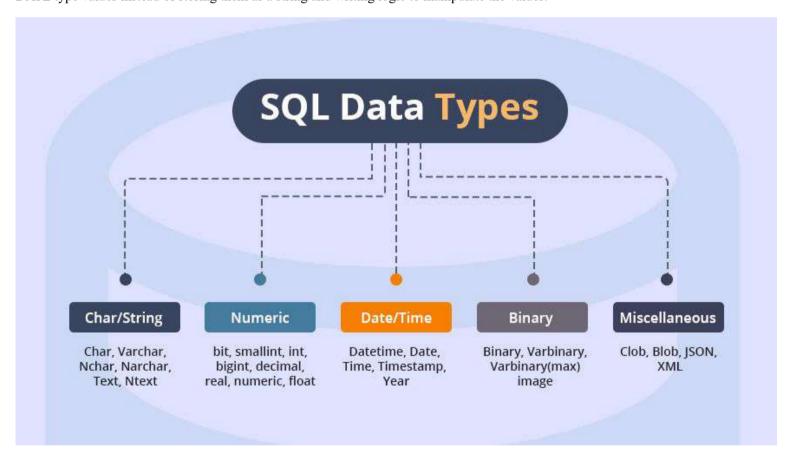

):

To delete this table, we would use the **DROP** command as follows:

DROP TABLE customers;

SQL Data Types for Server

To create tables for manipulating data effectively, we need to work with the correct data type. Let's say we want to work with dates, it would be easier to create a column for holding DATE type values instead of storing them as a string and writing logic to manipulate the values.

Every RDBMS is different and each RDBMS might have a different data type for working with certain values. The following sections of this SQL Cheat Sheet contain the various types of MySQL data types.

String Data Types

Data Type A fixed-length string that can contain numbers, letters, and special characters. The string length is from 0 - 255 CHAR(size) VARCHAR(size) Variable-length string similar to CHAR(), but with a length from 0 to 65535. TEXT(size) Holds a string of a maximum of 65,536 bytes. Holds a string of a maximum of 255 characters. **TINY TEXT MEDIUM TEXT** Holds a string with a maximum length of 16,777,215 characters. LONG TEXT Holds a string with a maximum length of 4,294,967,295 characters. BINARY(size) Similar to CHAR() but stores binary byte strings. VARBINARY(size) Similar to VARCHAR() but for binary byte strings. For holding blobs of up to 65,536 bytes. BLOB(size) Used for BLOBs (Binary Large Objects). Has a max length of 255 bytes. **TINYBLOB MEDIUMBLOB** Holds blobs of up to 16,777,215 bytes. Holds blobs of size up to 4,294,967,295 bytes. **LONGBLOB**

ENUM(val1,val2,...) A string object that can have only one value is chosen from a list of possible values of up to 65535 values in an ENUM list. If the value inserted is not in the list, a blank value will be inserted.

SET(val1,val2,...) A string object that can have 0 or more values, chosen from a list of possible values. You can list up to 64 values in a SET list.

Description

BIT(size)

INT(size)

A bit-value type. The size parameter can hold a value from 1 to 64. The default value for size is 1.

A medium integer with a signed range of -2147483648 to 2147483647, and an unsigned range from 0 to 4294967295.

TINYINT(size)

A very small integer. The signed range is from -128 to 127. The unsigned range is from 0 to 255.

A small integer. The signed range is from -32768 to 32767. The unsigned range is from 0 to 65535.

A medium integer. The signed range is from -8388608 to 8388607. The unsigned range is from 0 to 16777215.

A large integer. The signed range is from -9223372036854775808 to 9223372036854775807. The unsigned range is from 0 to 18446744073709551615.

BOOL/BOOLEAN Zero values are considered as FALSE and non-zero values are considered as TRUE.

FLOAT(p)

A floating-point value. If the precision parameter(p) is between 0 to 24, the data type is set to FLOAT(), and if it's from 25 to 53, the data type is set to DOUBLE(). This makes the storage of values more efficient.

A floating-point number value where the total digits are set by the size parameter,

DOUBLE(size,d) and the number of digits after the decimal point is set by the d parameter.

DEC(size,d)/ An exact fixed-point number with the total number of digits set by the size parameters, and the total number of digits after the decimal point set by DECIMAL(size,d) the d parameter. For size, the maximum number is 65 and the default is 10, while for d, the maximum number is 30 and the default being 10.

Note: All the numeric data types may have an extra option: UNSIGNED or ZEROFILL. If you add the UNSIGNED/ZEROFILL option, MySQL disallows negative values for the column.

Date/Time Data Types

Data Type

DATE

DATE

A simple date in YYYY-MM-DD format, supporting a range from '1000-01-01' to '9999-12-31'.

TIME(fsp)

DATETIME(fsp)

A time in hh:mm:ss format, with a supported range from '-838:59:59' to '838:59:59'

A date and time combination in YYYY-MM-DD hh:mm:ss format. The supported range is from '1000-01-01 00:00:00' to '9999-12-31 23:59:59'

A Unix Timestamp, which is a value relative to the number of seconds since the Unix epoch ('1970-01-01 00:00:00' UTC). This has a supported range from '1970-01-01 00:00:01' UTC to '2038-01-09 03:14:07' UTC.

YEAR

A simple date in YYYY-MM-DD format, supporting a range from '1000-01-01' to '9999-12-31'.

A date and time combination in YYYY-MM-DD hh:mm:ss format. The supported range is from '1000-01-01 00:00:00' to '9999-12-31 23:59:59'

A Unix Timestamp, which is a value relative to the number of seconds since the Unix epoch ('1970-01-01 00:00:00' UTC). This has a supported range from '1970-01-01 00:00:01' UTC to '2038-01-09 03:14:07' UTC.

A year in four-digit format with the range as - 1901 to 2155

CRUD Operations with SQL

Now that we have our table(s) ready, let's see how we can store and retrieve data from the tables in our database. In the following sections of this SQL Basics Cheat Sheet, we would look at the most basic SQL operations.

CRUD is an acronym that stands for Create, Read, Update, and Delete. These are the most fundamental operations that one can perform on any database. For creating any application, these 4 types of operations are crucial. They are:-

- 1. INSERT (Create)
- 2. SELECT (Read)
- 3. UPDATE (Update)
- 4. DELETE (Delete)

INSERT

To insert data into any table, we use the **INSERT INTO** statement. The general syntax for insert is:

INSERT INTO table_name(column1,column2,...)

VALUES(val1,val2,...);

To insert data into our customer's table, we would use the following statement:

INSERT INTO customers(ID,name,phone,postalCode)

VALUES(1,'Alice','+123456789',123456);

SELECT

To read data from a table, we would use the Select statement where we define the columns that we want to fetch. The general syntax is:

 ${\bf SELECT\ column1, column2,..\ FROM\ table_name;}$

If we wanted to select the name and phone number of a customer from our table, we would use:

SELECT name, phone **FROM** customers;

Also, to read all the columns from our table, we can replace the column names with * as follows:

SELECT * FROM customers;

UPDATE

To update specific column(s) of specific row(s), we make use of the Update statement. The general syntax for an update statement is:

UPDATE table_name

SET column1=value1,column2=value2,...

WHERE conditions...;

For example, if we wanted to update the phone number of a customer that has an ID of 2, we would write our query as:

UPDATE customers

SET phone='+2223334445'

WHEREID=2;

We can update multiple columns by adding them to the SET statement and we can target multiple rows by adding them to the WHERE statement. We will look at WHERE in detail in later sections of this SQL commands cheat sheet.

DELETE

If we wanted to remove some rows from a table, we would use the delete statement. The general syntax is:

DELETE FROM table_name

WHERE condition...;

Let's say we want to remove all the customers who live in a particular area. So, we simply delete those rows that have a specific area code:

DELETE FROM customers

WHERE postalCode=223344;

List of useful SQL Keywords

In the following section of this SQL Server Cheat Sheet, we will have a look at all the commands/keywords that we can use in SQL to work with data, tables, and databases.

Keyword	Description
ADD	Add a new column to an existing table. Eg: ALTER TABLE customers ADD email_address VARCHAR(255);
ALTER TABLE	Adds, deletes, or edits columns/constraints in a table. Eg: ALTER TABLE customers DROP COLUMN email_address;
ALTER COLUMN	Changes the data type of a table's column. Eg: ALTER TABLE customers ALTER COLUMN phone varchar(50)
AS	Renames a table or column with an alias value that only exists for the duration of the query. Eg: SELECT name AS customer_name, phone, postalCode FROM customers;
ASC	Used with ORDER BY to return the data in ascending order.
CHECK	Adds a constraint that limits the value which can be added to a column. Eg: CREATE TABLE Users(firstName varchar(255),age INT, CHECK(age>10));
CREATE DATABASE	Creates a new database. Eg: CREATE DATABASE my website;
CREATE TABLE	Creates a new table. Eg: CREATE TABLE users (id int,firsr_name varchar(255), surname varchar(255), address varchar(255), contact_number int);
DEFAULT	Set the default value for a column. Eg: CREATE TABLE products(ID int, name varchar(255) DEFAULT 'Username', from date DEFAULT GETDATE());
DELETE	Delete values from a table. DELETE FROM users WHERE user_id= 674;
DESC	Used with ORDER BY to return the data in descending order.
DROP COLUMN	Deletes a column from a table. ALTER TABLE users DROP COLUMN first_name;

DROP Deletes a complete database along with all the tables and data inside. Eg: DROP DATABASE my website; DATABASE DROP DEFAULT Removes a default value for a column. Eg: ALTER TABLE products ALTER COLUMN name DROP DEFAULT; **DROP TABLE** Delete a table from a database. Eg: DROP TABLE customers; **FROM** Specifies which table to select or delete data from. Eg: SELECT * FROM customers; Used with a WHERE clause as a shorthand for multiple OR conditions. Eg: SELECT * FROM users WHERE country IN('USA', 'United IN Kingdom','Russia'); IS NULL Tests for empty (NULL) values. Eg: SELECT * FROM users WHERE phone IS NULL; IS NOT NULL Opposite of IS NULL. Tests for values that are not null. LIKE Returns true if the operand value matches a pattern. SELECT * FROM users WHERE first_name LIKE '%son'; **ORDER BY** Used to sort the resultant data in ascending (default) or descending order. **SELECT** Same as SELECT, except duplicate values are excluded. Eg: SELECT DISTINCT postalCode from customers; DISTINCT Used alongside SELECT to return a set number of records from a table. Eg: SELECT TOP 5 * FROM customers; TOP Used alongside the INSERT INTO keyword to add new values to a table. Eg: INSERT INTO cars (name, model, year) VALUES ('Ford', 'Fiesta', **VALUES** 2010);

Filters result only includes data that meets the given condition. SELECT * FROM orders WHERE quantity > 1;

Operators in SQL

WHERE

SQL has various operators that allow you to manipulate and compare multiple values. These are very useful and handy while creating queries.

SQL Arithmetic Operators

Operator Description

- Addition
- Subtraction
- Multiply
- Divide
- Modulo

SQL Bitwise Operators

Operator Description

- Bitwise AND &
- Bitwise OR
- Bitwise Exclusive OR

SQL Comparison Operators

- Equal to
- > **Greater Than**
- Less Than
- Greater than or equal to >=
- Less than or equal to <=
- Not Equal to <>

SQL Compound Operators

Operator Description

^_=

- Add Equals
- Subtract Equals -=
- *= **Multiply Equals**
- /= Divide Equals
- Modulo Equals %=
- Bitwise AND Equals &=

Bitwise Exclusive Equals

|*= Bitwise OR Equals

SQL Logical Operators

Operator	Description
ALL	TRUE if all of the subquery values meet the condition
AND	TRUE if all the conditions separated by AND is TRUE
ANY	TRUE if any of the subquery values meet the condition
BETWEEN	TRUE if the operand is within the range of comparisons
EXISTS	TRUE if the subquery returns one or more records
IN	TRUE if the operand is equal to one of a list of expressions
LIKE	TRUE if the operand matches a pattern
NOT	Displays a record if the condition(s) is NOT TRUE
OR	TRUE if any of the conditions separated by OR is TRUE
SOME	TRUE if any of the subquery values meet the condition

SQL Keys

In a database, different tables store different values and these values are related to each other. To identify each row uniquely, we make use of SQL keys. An SQL key is either a single column (or attribute) or a group of columns that can uniquely identify rows in a table. SQL Keys ensures that there aren't any rows with duplicate values.

However, the most powerful use of keys is to establish relations between multiple tables in a database. To do so, we need to understand Primary Key and Foreign Key. The following sections of this SQL cheatsheet explain both of these concepts.

Primary Key

It is a key that uniquely identifies a single row in a table. For example, in a customer's table, the ID key can be used as a primary key to uniquely identify a single customer. This key can then be used to fetch data from multiple tables that have data related to the customer.

Key Points:

- 1. There can only be One Primary Key for a Table.
- 2. Primary Key should be unique for Each Row.
- 3. Primary key cannot have Null Values.

Typically, the primary key in a table is the ID column and is usually paired with the AUTO_INCREMENT keyword to uniquely identify the row. To mark a column as the primary key, we use the PRIMARY KEY keyword followed by the column/columns that consist of the primary key. For Example: -

```
CREATE TABLE users (
   id int NOT NULL AUTO_INCREMENT,
   first_name varchar(255) NOT NULL,
   last_name varchar(255) NOT NULL,
   address varchar(255),
   email varchar(255) NOT NULL,
   PRIMARY KEY (id)
);
```

Foreign Key

A foreign key is a field in a table that references the PRIMARY KEY of another table. A foreign key is used to link two tables together by establishing a relationship.

The table that contains the foreign key is known as the child table, while the table containing the primary key for the foreign key is known as the parent table.

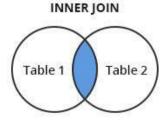

For example: Let's say we have 3 different tables to manage a restaurant - products, users, and orders. In our products table, we list all our products and in the user's table, we have details of all our users. When a user places an order, we save the data in the orders table. But, instead of saving the complete details of the product and all the information of the user, we save their primary keys in the orders table.

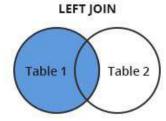

```
CREATE TABLE orders(
    order_id INT NOT NULL,
    user_id INT,
    product_id int,
    PRIMARY KEY(order_id),
    FOREIGN KEY(user_id) REFERENCES users(id),
    FOREIGN KEY(product_id) REFERENCES products(id)
);
```

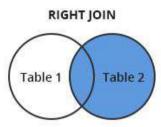

Here, we create a primary key for the order ID as it uniquely identifies an order. Also, we create two foreign keys that reference different primary keys.

SQL Joins

Once you understand Primary Key and Foreign Key, you can use joins to fetch data by combining multiple tables. Let's take the orders, customers, and products table as an example.

Products:

product_id product_name price 1 Burger 10

2 Sandwich 15

Customers:

customer_	id customer_name	email
1	Alice	alice@alice.com
2	Bob	bob@bob.com

Orders:

order_id customer_id product_id

1	1	1
2	1	2
3	2	1

We can join the orders table with customers and products table to get only the information that we require. Let's say we want to see all the orders with the customer's name, product name, and product price as follows:

order_id product_name customer_name price

1	Burger	Alice	10
2	Sandwich	Alice	15
3	Burger	Boh	10

To do so, we would use join in SQL as follows:

SELECT orders.order_id, products.product_name,customers.customer_name,products.price
FROM orders
INNER JOIN products ON products.product_id = order.product_id
INNER JOIN customers on customers.customer_id = order.customer_id;

SQL has Different Types of Joins that Help Achieve Different Results:

- 1. INNER JOIN Returns any records which have matching values in both tables.
- 2. LEFT JOIN Returns all of the records from the first table, along with any matching records from the second table
- 3. RIGHT JOIN Returns all of the records from the second table, along with any matching records from the first
- 4. FULL JOIN Returns all records from both tables when there is a match

SQL Cheatsheet for SELECT Queries

1. Retrieve specific columns

SELECT userId,name,age,phone,country FROM Users;

2. Retrieve all Columns

SELECT * FROM Users;

3. Retrieve Filtered Rows

SELECT * FROM Users WHERE age>18;

4. Retrieve Distinct Rows

 ${\tt SELECT\ DISTINCT\ country\ from\ Users;}$

5. Count the Filtered Rows

SELECT COUNT(*) FROM users WHERE age>18;

6. Sort Rows Based on Criteria

SELECT * FROM Users ORDER BY userId ASC/DESC;

Note: You can use ASC for Ascending Order or DESC for descending order. If nothing is specified, sorting is done in Ascending order(ASC).

7. Retrieve Limited Rows

SELECT * FROM Users WHERE country='india' LIMIT 20;

8. Retrieve and Skip/Offset Rows

SELECT * FROM Users ORDER BY userId OFFSET 10 ROWS;

9. Get Average, Sum, Max, Min, etc. of Results

SELECT AVG(age) FROM USERS;

10. Get all Values from two Tables

SELECT * FROM Users INNER JOIN Wallets ON Users.walletId = Wallets.walletId;

Note:- We can use any type of join that we want. The condition via which we want to join the tables needs to be specified after the ON keyword.

11. Get selected values from two tables

```
SELECT us.userId,us.name,wall.walletId,wall.balance FROM Users AS us INNER JOIN Wallets AS wall
```

Note: - We use the AS keyword to give an alias to a table to make our SELECT statement shorter. We can even eliminate the AS keyword in this case and simply write the Alias after the table name.

SQL Cheatsheet for INSERT Queries

1. Insert All Values in Order a Table

INSERT INTO Users VALUES('Kanak Infosystems', 'sales@kanakinfosystems.com',9876543210);

2. Insert Selected Values in a Table

INSERT INTO Users(userName,email) VALUES('Kanak Infosystems', 'sales@kanakinfosystems.com');

3. Insert Multiple Rows

```
INSERT INTO User(userName) VALUES
('user1'),
('user2');
```

Note: - We separate each row with a pair of brackets followed by a comma.

SQL Cheatsheet for TABLE Queries

1. Create a New Table

```
CREATE TABLE Users(
    id INT PRIMARY KEY,
    userName VARCHAR(50),
    age INT DEFAULT 10
);
```

2. Delete a Table

DROP TABLE Users;

3. Remove all Values from a Table

TRUNCATE TABLE Users;

4. Add a Column to the Table

ALTER TABLE Users ADD COLUMN country VARCHAR(20);

5. Remove a Column from a Table

ALTER TABLE Users DROP COLUMN country;

6. Rename a Table

ALTER TABLE Users RENAME TO Customers;

7. Rename a Column

ALTER TABLE Users RENAME userName to name;

SQL Cheat Sheet for UPDATE/DELETE Queries

1. Update Column Value for all Rows

UPDATE Users SET country='india';

2. Update Column Value for Selected Rows

UPDATE Users SET isEligible='true' WHERE age>=18;

3. Delete all Rows

DELETE FROM Users;

4. Delete Specific Rows

DELETE FROM Users WHERE age<18;

SQL Cheat Sheet for SELECT Filters

1. Filter by Multiple Matching Conditions

SELECT * FROM Users WHERE age>=18 AND country='india';

2. Filter Rows by Multiple Parallel Conditions

SELECT * FROM Users WHERE country='india' OR name LIKE 'Kan%';

3. Filter Rows Based on Values in a List

SELECT * FROM Users WHERE age IN (15,18,22,27);

4. Filter Rows with Values in a Range

SELECT * FROM Users WHERE age BETWEEN 25 AND 30

Conclusion

SQL is a definite requirement when you are trying to build an application of any size and scale. Learning SQL might be tough for beginners, but once you get the hang of it, it's just like thinking.

Make sure to bookmark this page and download the SQL cheat sheet pdf if you are working with SQL. If you can remember a particular operation or keyword, you can open up this SQL commands cheat sheet to get all the required information.
